

Giant Marine Snow Catcher

OSIL

OSIL'S Giant Marine Snow Catcher is a device for collecting 'marine snow' in an undamaged form

The Giant Marine Snow Catcher is a large volume water bottle that can be deployed to collect Marine Snow particles with the minimum of trauma.

The principle of this device relies on the rapidity with which marine snow particles sink when enclosed in still water. 300 litres of water are collected in a messenger-operated PVC water bottle. Water transport through the device during descent is controlled through two large diameter terminal apertures constructed to reduce turbulence.

Benefits:

- Robust construction
- Modular design makes it easy to replace damaged parts
- Simple structure to work on/with

After recovery, the device remains upright on deck for two hours to allow the marine snow particles to sink to the bottom. The top section of water is slowly drained through various taps. The bottom section of the water bottle, containing the remaining water and the marine snow, is then disconnected. This lower section can then be taken into the laboratory where the marine snow particles are photographed and removed from the flat bottom of the chamber with a wide-bore pipette. The bottom chamber has transparent sides through which spot lights can be directed to increase the visibility of the settled marine snow particles.

Features:

- Extra Large Volume
- Minimal Turbulence
- Controlled Separation

Specifications:

- Dimension: 300 x 70cm Ø
- Weight (in air): 170kg
- Sample Volume: 300 litres

Applications:

- Carbon Flux Studies
- Food Chain
- Marine Snow Analysis
